

Dear Sir,

I saw your profile and I would like to ask if you will be able to create a game with certain criteria.

1. I would like to have a Main Menu, where you can choose a game  
(let's assume 6 games to choose)

2. Screen ratio **16:9 vertical**
3. When I choose (mouse click) one of these images it will run the chosen game.  
For now I want to have developed **only one game**, so wherever game image user choose program **will always run the same game**.
4. I would like to have each game running as **independent proces** (no overlapping of the selected game processes) so when you finish the game, it will kill that process, **return to main menu** and you can choose another game. Then again, after new game is selected it will start new process with selected game. After finish it return to Main Menu. And so on.
5. Developed game should be simple. Like Mario game. **Guy going constantly in the right direction** jumping to avoid obstacles and shooting to kill enemy. Simple as that.  
Jump to avoid obstacles and shoot to kill enemy.
